

ABSTRACT

Blemish is a web based application which is developed to provide accurate solutions for java developers and also solving other related problems while programming. Blemish means a mark or a disturbance which spoils the appearance or quality of something.

Now a days the usage of internet had been increased rapidly. The users made it as a part of one's life. So, In order to interact with the users we had developed a web based application which is a step for software employees, users and others to interact with others. We enable them to interact them easily with our application.

In Modern world especially in cyber industry many software employees are facing a lot of problems in programming, developing stages. So, To provide the solutions to employees in an accurate and fast way we had put forward this application. We also provide security for the data provided by different users. We also make use of algorithms to provide easy availability of solutions. Test similarity algorithm will check the text of similar queries in blemish application. We provide less overhead when compared with other possibilities.

As mentioned, we implement this application with a basic assumption.
